

Refurbished and Retrofitted Equipment & Systems

Industries Served: All

Many existing systems have been operating well over the years, but have components, instruments, or automation that requires upgrades. Others may not provide all the features required for a new process or application. Many equipment owners look toward procurement of new equipment without considering upgrading the current systems in operation. In many of the cases, small improvements to current equipment are all that are required to update and upgrade the current system, allowing additional years of use at a fraction of the cost of a new system. DivInd has the experience to refurbish used systems, retrofit current equipment in the field, or offer kits with replacement components that will update any system in use. Our ability to tie in different automation controls, as well as modify existing control systems provide the right improvements without additional costs involved in facility improvements.
