

## Test Stands & Fixtures

### Industries Served: All

The need to operate multiple setups for product qualification and research, quality control, or reliability, DivIND's background in industrial design offers the best solutions. Automated solutions for testing components and materials from abrasive slurries on valves to leak checks on latex gloves, test stands serve to reduce manual interaction while improving statistics on data analysis. Multiple points and sources can track specific properties of the media tested and can record times of failure for certain applications. DivIND can also provide systems allowing setup and qualification of products, such as flow meters, to be tuned for an exact application, reducing setup time in the field.
